

# LungCT-Diagnosis

## Summary

All the images are diagnostic contrast enhanced CT scans. The images were retrospectively acquired, to ensure sufficient patient follow-up. Slice thickness is variable : between 3 and 6 mm. All images were done at diagnosis and prior to surgery. The objective of the study was to extract prognostic image features that will describe lung adenocarcinomas and will associate with overall survival.

Two CT features were developed to quantitatively describe lung adenocarcinomas by scoring tumor shape complexity and intratumor density variation using routinely obtained diagnostic CT scans. The features systematically scored tumors and identified imaging phenotypes which exhibited survival differences. The features were extracted from routinely obtained CT images and were reproducible and stable despite the inherent clinical image acquisition variability. Our results suggest that quantitative imaging features can be used as an additional diagnostic tool in management of lung adenocarcinomas. More information is available in the related publication (see Citation tab below).

## Acknowledgements

We would like to acknowledge the individual and institution that have provided data for this collection:

- **Moffitt Cancer Center** (Tampa Florida) - Special thanks to **Olya Stringfield, PhD** from the **Department of Cancer Imaging and Metabolism** .

## Third Party Analyses of this Dataset

TCIA encourages the community to [publish your analyses of our datasets](#). Below is a list of such third party analyses published using this Collection:

- [Long and Short Survival in Adenocarcinoma Lung CTs](#)

### Detailed Description

## Detailed Description

Collection Statistics	Updated 12/30/2014
Modalities	CT
Number of Participants	61
Number of Studies	61
Number of Series	61
Number of Images	4,682
Images Size (GB)	2.5

TCIA DICOM Subject ID, SOP Instance UID, Instance Number, and Image Position (Patient) X-Y-Z are noted in [Representative-Tumor-Slices.xlsx](#)

The accompanying data are [survival data \(status: dead or alive, survival time in months\)](#) and [pathological stage \(TNM\)](#).
