

NSCLC Radiogenomics: Initial Stanford Study of 26 Cases (NSCLC Radiogenomics-Stanford)

Description

This subset of [NSCLC Radiogenomics](#) contains images from patients with non-small cell lung cancer (NSCLC) imaged prior to surgical excision with both thin-section computed tomography (CT) and whole body positron emissions tomography (PET) /CT scans acquired under Institutional Review Board approval from Stanford University and the Veterans Administration Palo Alto Health Care System. The first installment of 26 cases (see shared list "NSCLC Radiogenomics: Initial Stanford Study of 26 Cases") corresponds to microarray data acquired from the excised samples, which is available on the National Center for Biotechnology Information (NCBI) [Gene Expression Omnibus](#), where Digital Imaging and Communications in Medicine (DICOM) patient names are identical to microarray sample names.

For scientific and other inquiries about this dataset, please [contact TCIA's Helpdesk](#).

Data Access

Data Access

Data Type	Download all or Query/Filter	License
Images (DICOM, 7.7 GB)	Download (Requires NBIA Data Retriever)	CC BY 3.0
Microarray Samples	Search	CC BY 3.0

Collections Used in this Third Party Analysis

Below is a list of the Collections used in these analyses:

- [NSCLC Radiogenomics](#)

Detailed Description

Detailed Description

The original 26 cases referenced in this manuscript have been renamed. A list of the mapping between GSM-XXX Patient IDs and R01-XXX Patient IDs can be found [here](#).

	Radiology Statistics
Image Size (GB)	7.7
Modalities	CT, PT, SEG
Number of Images	23,081
Number of Participants	26
Number of Series	119
Number of Studies	51
