

NSCLC-Radiomics-Genomics

Summary

Redirection Notice

This page will redirect to <https://www.cancerimagingarchive.net/collection/nsclc-radiomics-genomics/> in about 5 seconds.

This collection contains images from 89 non-small cell lung cancer (NSCLC) patients that were treated with surgery. For these patients pretreatment CT scans, gene expression, and clinical data are available. This dataset refers to the Lung3 dataset of the [study published in Nature Communications](#).

In short, this publication applies a radiomic approach to computed tomography data of 1,019 patients with lung or head-and-neck cancer. Radiomics refers to the comprehensive quantification of tumour phenotypes by applying a large number of quantitative image features. In present analysis 440 features quantifying tumour image intensity, shape and texture, were extracted. We found that a large number of radiomic features have prognostic power in independent data sets, many of which were not identified as significant before. Radiogenomics analysis revealed that a prognostic radiomic signature, capturing intra-tumour heterogeneity, was associated with underlying gene-expression patterns. These data suggest that radiomics identifies a general prognostic phenotype existing in both lung and head-and-neck cancer. This may have a clinical impact as imaging is routinely used in clinical practice, providing an unprecedented opportunity to improve decision-support in cancer treatment at low cost.

The dataset described here (Lung3) was used to investigate the association of radiomic imaging features with gene-expression profiles. The Lung2 dataset used for training the radiomic biomarker and consisting of 422 NSCLC CT scans with outcome data can be found here: [NSCLC-Radiomics](#). Other data sets in the Cancer Imaging Archive that were used in the same [study published in Nature Communications](#): HEAD-NECK-RADIOMICS-HN1, [NSCLC-Radiomics-Interobserver1](#), RIDER Lung CT Segmentation Labels from: Decoding tumour phenotype by noninvasive imaging using a quantitative radiomics approach (RIDER-LungCT-Seg).

Additional Resources for this Dataset

The following external resources have been made available by the data submitters. These are not hosted or supported by TCIA, but may be useful to researchers utilizing this collection.

- [Gene Expression](#)

The NCI Cancer Research Data Commons (CRDC) provides access to additional data and a cloud-based data science infrastructure that connects data sets with analytics tools to allow users to share, integrate, analyze, and visualize cancer research data.

- [Imaging Data Commons \(IDC\)](#) (Imaging Data)

Detailed Description**Detailed Description**

Collection Statistics	
Modalities	CT
Number of Participants	89
Number of Studies	89
Number of Series	89
Number of Images	13,482
Image Size (GB)	6.6

Gene-expression Data

Corresponding microarray data acquired for the imaging samples are available at National Center for Biotechnology Information (NCBI) Gene Expression Omnibus (Link to GEO: <http://www.ncbi.nlm.nih.gov/geo/query/acc.cgi?acc=GSE58661>). The patient names used to identify the cases on GEO are identical to those used in the DICOM files on TCIA and in the clinical data spreadsheet.

Clinical Data

Corresponding clinical data can be found here: [Lung3.metadata.xls](#). DICOM patients names are identical in TCIA and clinical data file.
